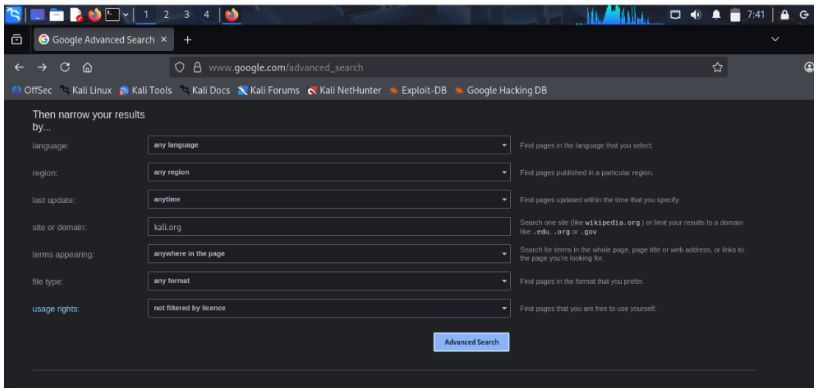
THREAT INTELLIGENCE TOOLS PRATICAL ASSIGNMENT

Assignment Objectives

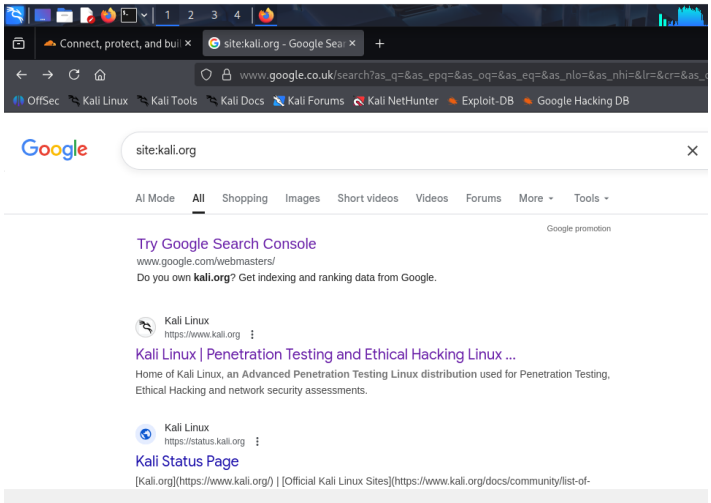
- Familiarize participants with core Threat Intelligence tools
- Demonstrate how reconnaissance is performed using publicly available data
- Encourage analytical thinking by requiring participants to derive the objective of each tool themselves
- Prepare participants for live Threat Intelligence investigations

1. **Google Dorks –** It helps to identify publicly available information in order to understand how exposed files, pages, or directories could potentially be misused if proper security controls are not in place.

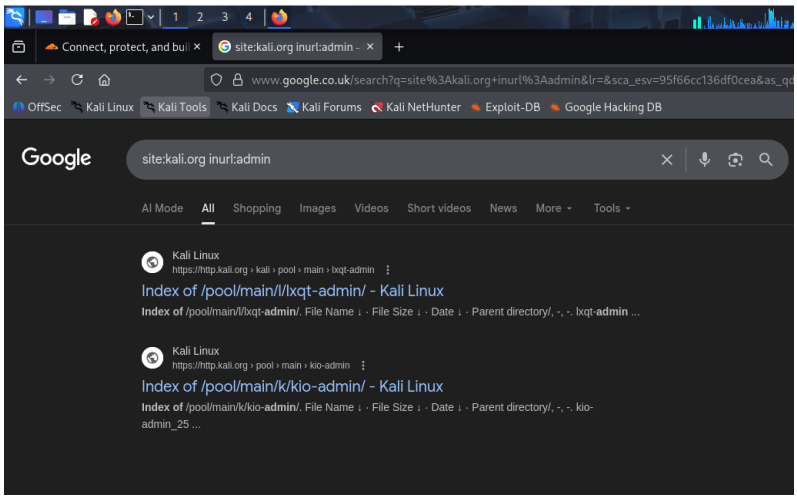
   Queries:



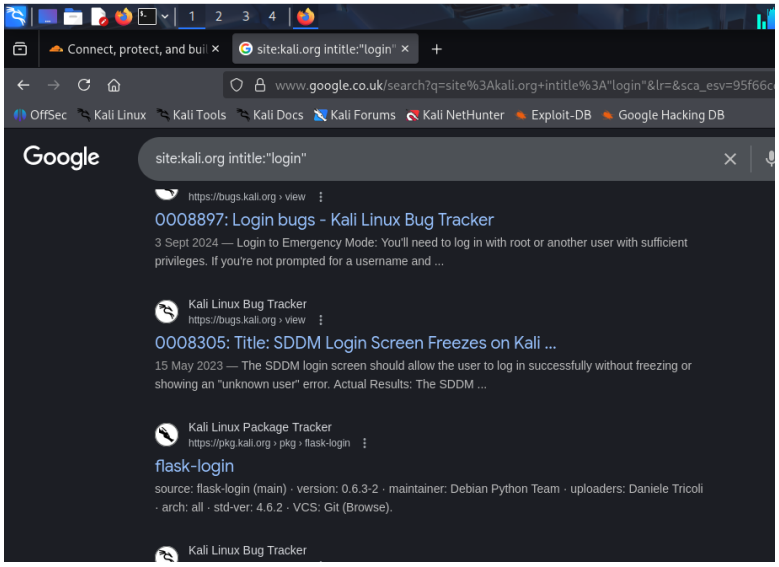
- **site:target.com**



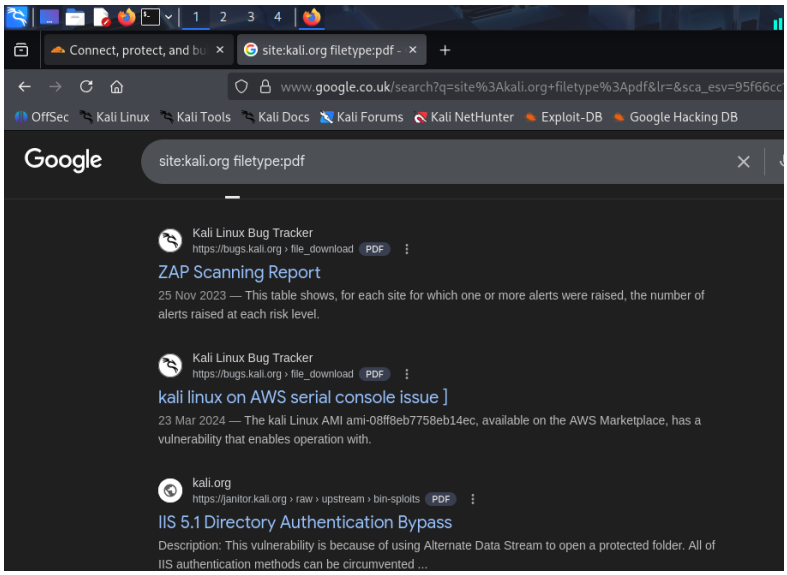
- site:kali.org inurl:admin



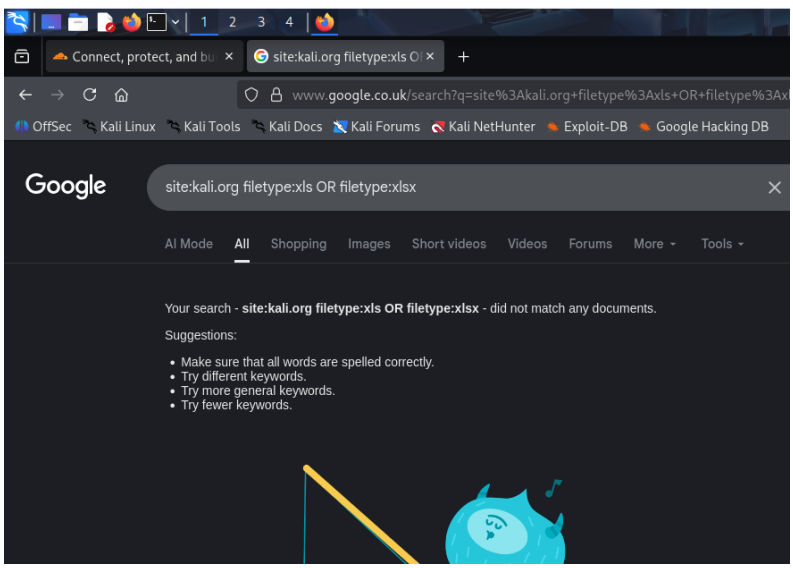
- site:kali.org intitle:"login"



- site:kali.org filetype:pdf



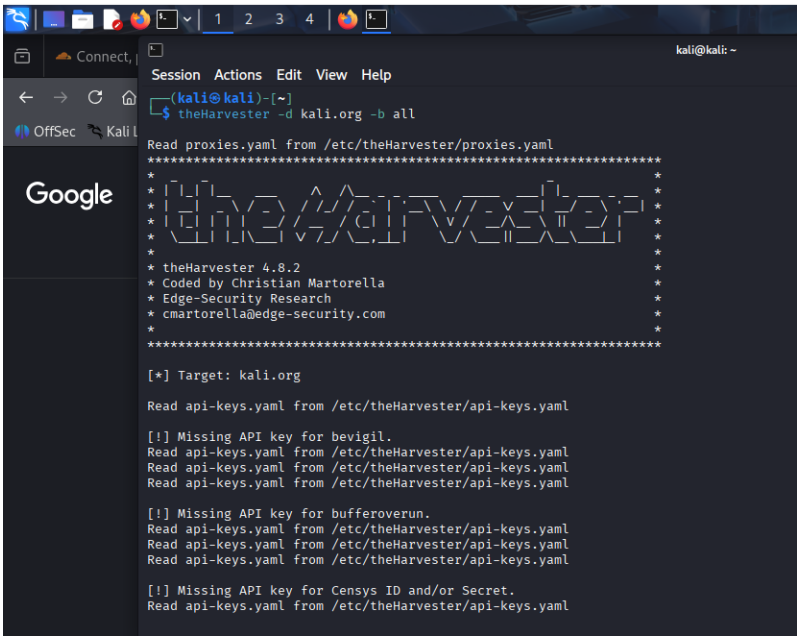
- site:kali.org filetype:xls OR filetype:xlsx

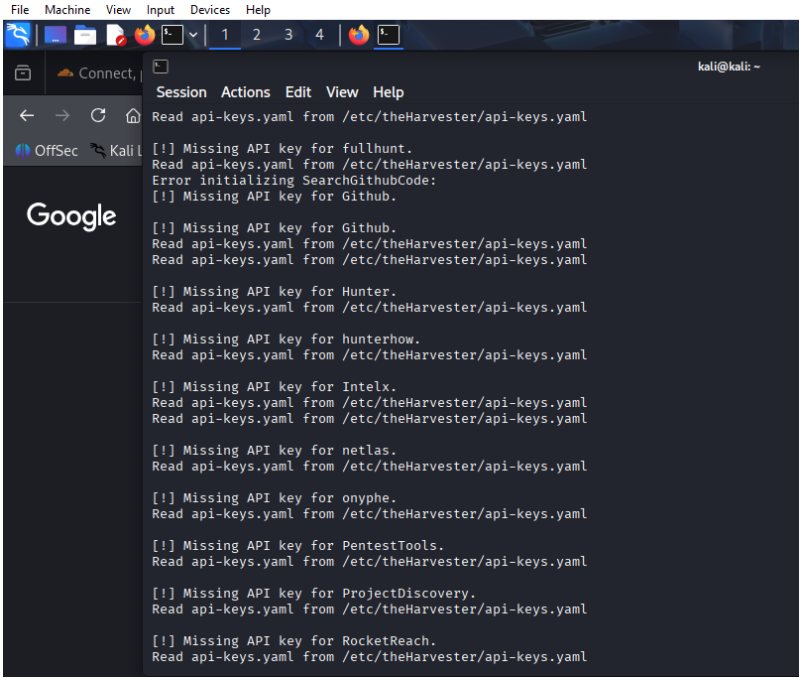


Step 2:

theHarvesters: It helps to gather publicly available information such as subdomains, hostnames, and email addresses in order to understand how attackers may perform reconnaissance during the early stages of an attack.

Command: theHarvester -d kali.org -b all



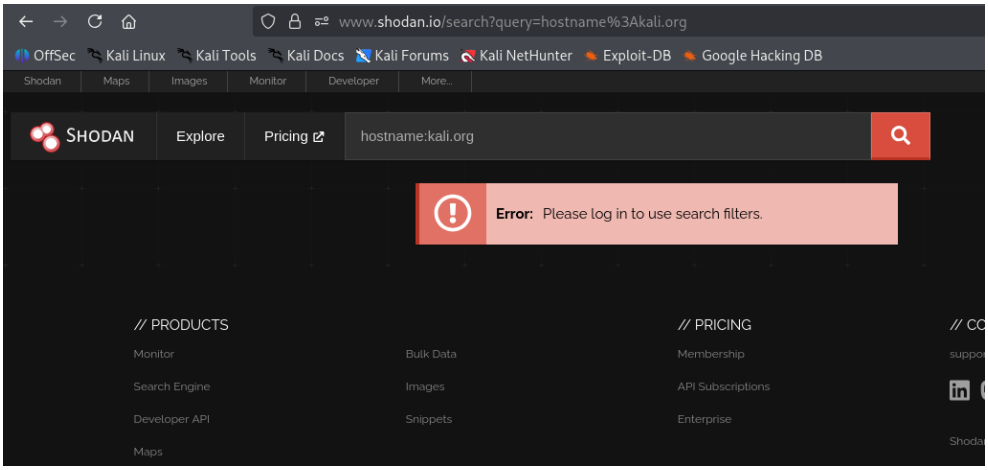


Step 3:

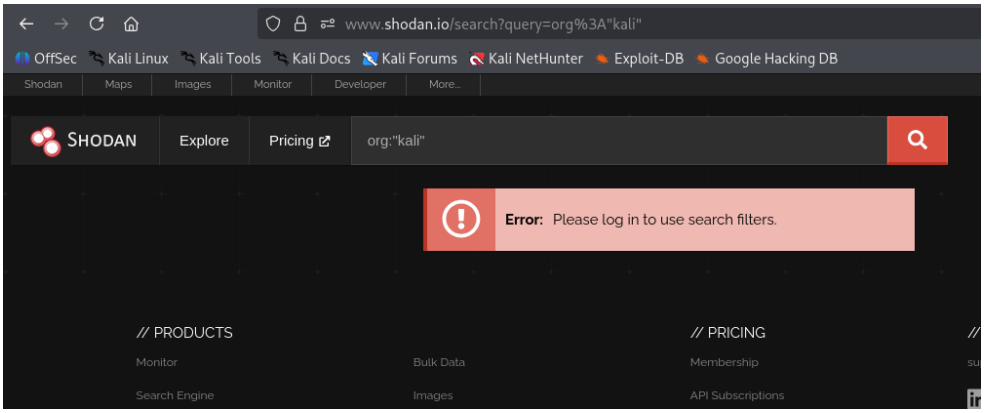
Shodan: To identify publicly exposed services, open ports, and technologies associated with kali.org in order to understand how attackers can gather reconnaissance data from internet-facing systems without directly interacting with the target.

Queries

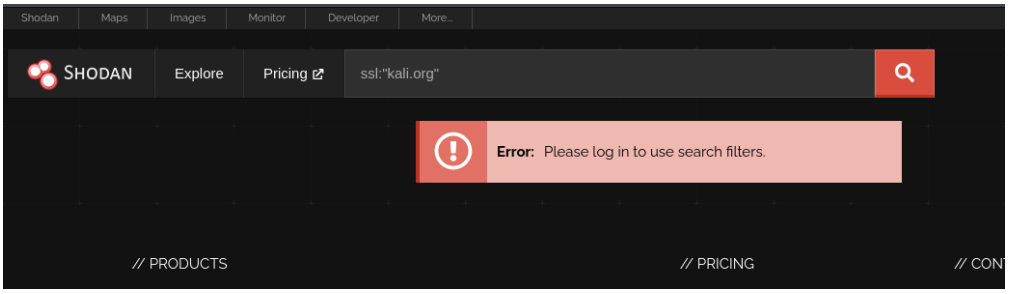
hostname:kali.org



org:"Target Organization Name"



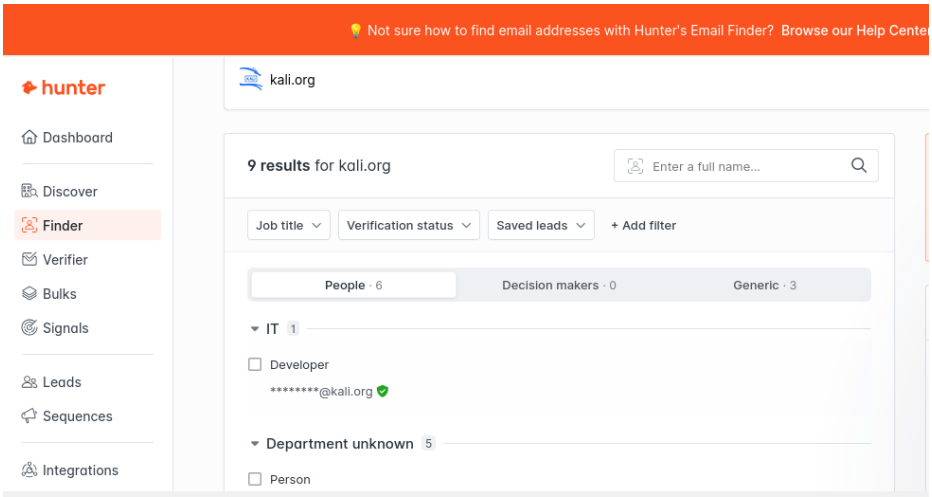
ssl:"target.com"

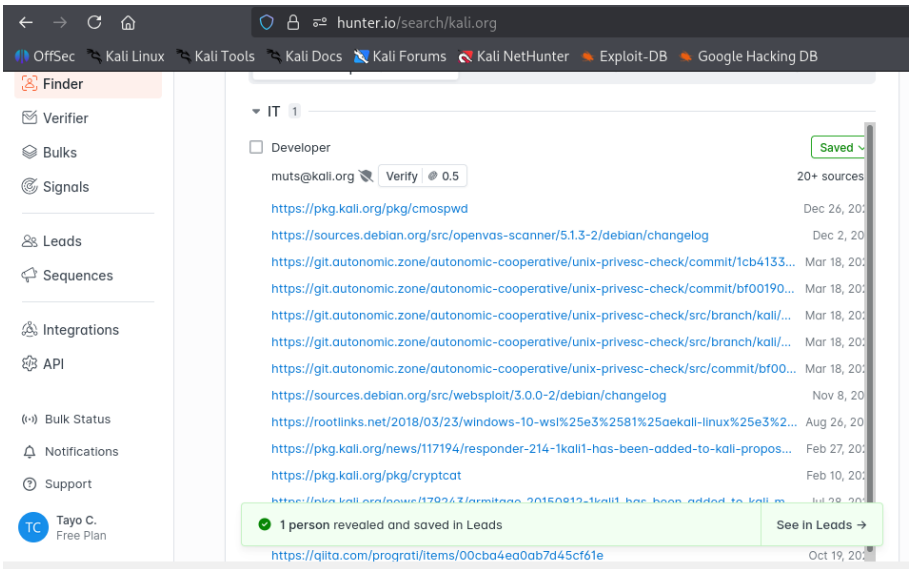


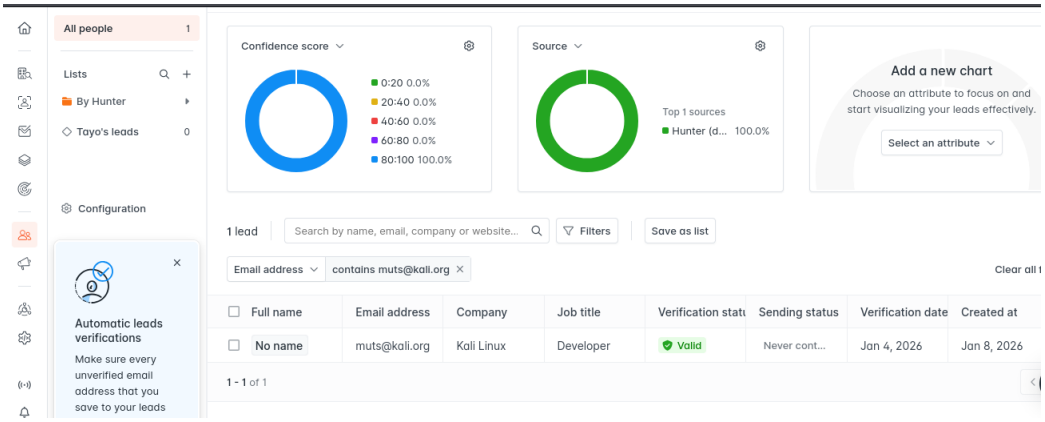
Step 5:

Hunter.io: It helps to discover domain-related email addresses and patterns from open sources for reconnaissance and defensive awareness.

Queries: Kali.org



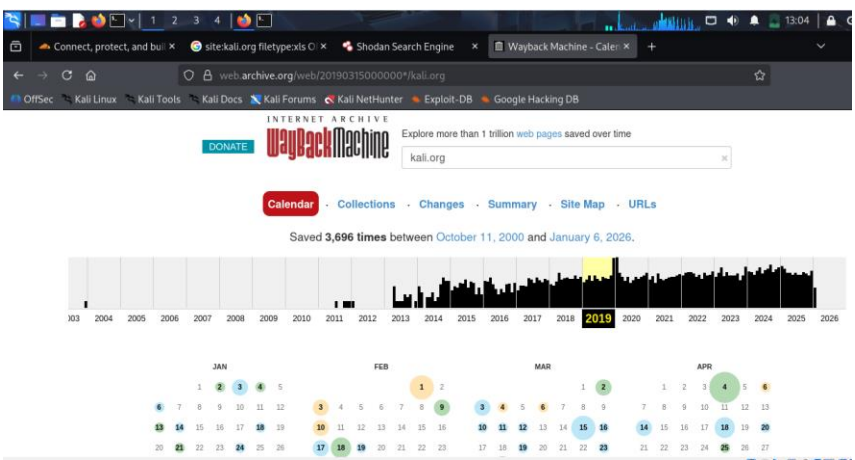




Step 5:

Wayback Machine: To analyze historical versions of kali.org in order to understand how publicly available website content has changed over time and to identify any previously exposed information that could be useful during reconnaissance.

Queries: https://web.archive.org



Observation: The archived version of kali.org from five years ago shows differences in website layout and content compared to the current site. The older snapshot contains fewer features and a simpler structure, reflecting the evolution of the platform over time.

Step 6:

VirusTotal: It helps to assess the reputation and threat intelligence associated with kali.org by reviewing detection ratios, historical data, and community information in order to support defensive threat assessment.

Queries: https://www.virustotal.com/

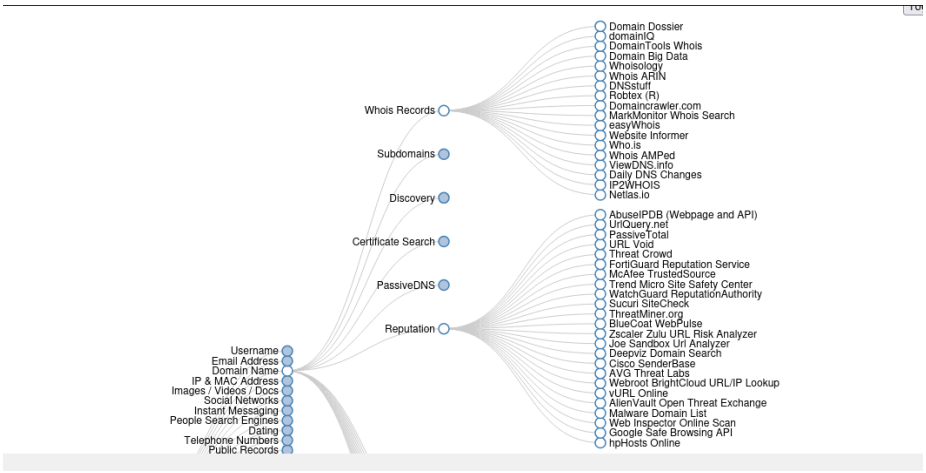
Observations: VirusTotal did not report any malicious detections associated with kali.org. The detection ratio showed zero or minimal flags from security vendors, and the domain appears to have a positive reputation. Historical and community data did not indicate malicious activity.

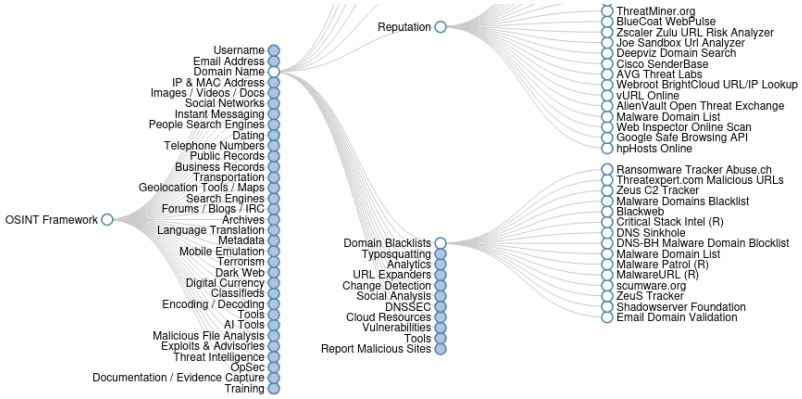
Threat Assessment Value: VirusTotal provides aggregated intelligence from multiple security vendors, making it useful for identifying known malicious domains or IP addresses. In this case, the absence of detections suggests that kali.org is a trusted and legitimate domain. From a defensive perspective, this confirms that the domain is not associated with known malware, phishing, or command-and-control activity.

Step 7

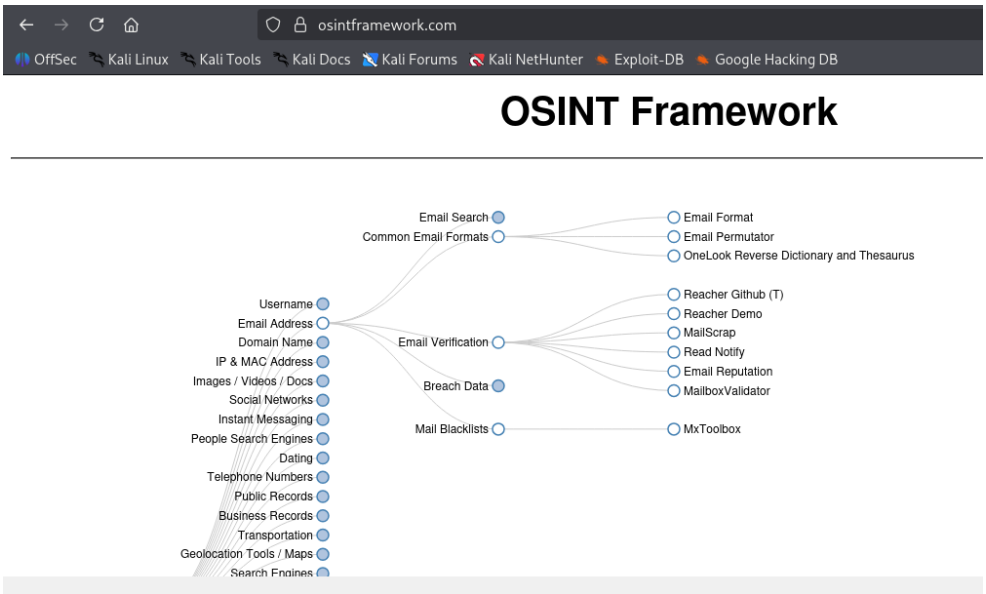
OSINT Framework: To explore the OSINT Framework and identify open-source tools relevant to domain, email, and IP intelligence in order to understand how publicly available information can support reconnaissance activities.

Domain: These tools provide information about domain owner, registration details, DNS records, and subdomains. During reconnaissance, attackers and defenders can use this data to map a target's infrastructure and identify associated systems.

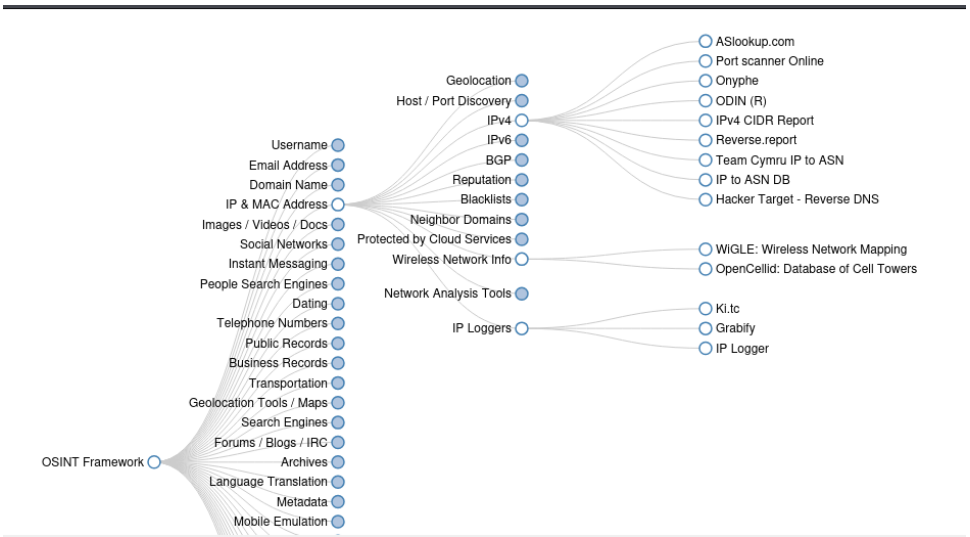




Email Intelligence: Email intelligence tools help identify exposed or breached email addresses linked to a domain. Attackers may use this information for phishing or social engineering, while defenders can assess exposure risks.



IP Intelligence: IP intelligence tools reveal open ports, services, reputation data, and historical activity associated with IP addresses. This information helps identify potential attack surfaces and assess system exposure.



Reconnaissance Activities: The OSINT Framework organizes publicly available intelligence tools into structured categories, making it easier to perform reconnaissance efficiently. By combining domain, email, and IP intelligence, attackers can build a detailed profile of a target's digital footprint without direct interaction. Defenders can use the same framework to identify and mitigate information exposure.

Step 8:

MITRE ATT&CK Framework:

Reconnaissance Tactic: The Reconnaissance tactic in MITRE ATT&CK describes techniques attackers use to gather information about a target before launching an attack. These activities often rely on open-source intelligence (OSINT) and do not require direct interaction with the target systems.

Mapping Table (Tool → Finding → ATT&CK Technique)

Tools	Findings	ATT&CK Technique	Relevance
Google Dorks	Public webpages and documents indexed for kali.org	T1593 – Search Open Websites/Domains	Shows how attackers search publicly indexed web content to discover exposed information
theHarvesters	Identified subdomains and hosts (limited results)	T1590 – Gather Victim Network Information	Shows how attackers enumerate domain-related infrastructure using public sources
Shodan	No exposed services found	T1590 – Gather Victim Network Information	Illustrates passive scanning to identify internet-facing systems, even when no results are returned
Wayback Machine	Historical versions of kali.org website	T1593 – Search Open Websites/Domains	Highlights how archived web content can reveal older site structure and removed resources
Virus Total	Reputation and historical intelligence for kali.org	T1593 – Search Open Websites/Domains	Uses aggregated public threat intelligence to assess domain reputation
OSINT Framework	Identification of domain, email, and IP intelligence tools	T1589 – Gather Victim Identity Information	Shows how attackers and defenders organize identity-related intelligence sources
